Transaction Analytics Dashboard

Business Intelligence & Transaction Performance Analysis

A portfolio-ready case study documenting the transformation of digital payment transaction data into an interactive decision-support dashboard.

PREPARED BY

PROJECT INFORMATION	
PROJECT	PhonePe Transaction Analytics Dashboard
PROJECT TYPE	Business Intelligence / Business Analytics / Power BI
PRIMARY TOOL	Microsoft Power BI
AUTHOR	Shivam Patel
DASHBOARD FILE	PhonePay_Analysis(2).pbix
REPOSITORY PURPOSE	Business Analytics portfolio and project demonstration

01 Executive Summary

The PhonePe Transaction Analytics Dashboard is a Power BI business intelligence project focused on understanding transaction performance, customer behavior, service-level value contribution, and usage patterns. The dashboard converts transaction-oriented data into an interactive management view with executive KPIs, trend analysis, demographic segmentation, service analysis, customer ranking, and payment-status filtering.

TOTAL TRANSACTIONS	TOTAL TRANSACTION VALUE	UNIQUE USERS	SUCCESSFUL RATE
300K	**₹3.47B**	**108K**	**96.00%**
+8.97% MoM	+8.98% MoM	Dashboard KPI	Payment performance

At dashboard level, the analysis reports approximately **300K transactions**, **₹3.47B** in total transaction value, **108K unique users**, and a **96.00%** successful transaction rate. Transaction volume and transaction value show approximately 9% month-over-month growth, providing a positive performance signal within the displayed reporting context.

37.4%
Gen X leads
Largest displayed age segment, narrowly ahead of Millennials.

₹2.5B
Loans drive value
Highest transaction value among the displayed services.

71.6%
Weekday-dominant
Share of usage that occurs on weekdays.

These findings illustrate how a dashboard can help stakeholders prioritize customer engagement, service performance monitoring, and payment reliability analysis.

02 Business Problem

Digital payment platforms generate large volumes of transactions across users, services, time periods, and payment outcomes. A business-facing analytical layer is needed to turn these records into a consistent view of performance and customer activity.

The project addresses the need to:

- Monitor transaction volume and transaction value from an executive perspective.
- Understand customer behavior across age segments and high-value users.
- Track payment performance using successful transaction rate and payment-status filtering.
- Compare transaction value generated by major service categories.
- Identify changes in transaction activity over time.
- Compare weekday and weekend usage patterns.
- Present the analysis in an interactive format suitable for business review.

DATA POSITIONING
This is a portfolio analytics project using the provided dataset. The analysis should not be interpreted as official internal PhonePe reporting or as a representation of PhonePe's actual business performance.

03 Business Objectives

The dashboard was designed around a set of practical business intelligence objectives:

01 Monitor transaction volume and monetary transaction value.

02 Track payment success performance.

03 Understand customer contribution by age segment.

04 Identify high-value customers based on transaction value.

05 Compare service categories by transaction value.

06 Analyze transaction behavior across the reporting period.

07 Compare weekday and weekend usage.

08 Provide interactive filtering for month and payment status.

09 Create a single decision-support view for business stakeholders.

SUCCESS CRITERIA

The project succeeds when a stakeholder can open the dashboard, understand the core KPIs within seconds, filter the view without rebuilding analysis, identify major performance patterns, and translate those observations into business questions or actions.

04 Dataset Overview

The dashboard is structured around transaction, user, service, payment-status, date, and demographic information required to answer the defined business questions. This report describes the data at a business level.

Data Area	Business Purpose
Transaction Data	Measure overall payment activity and transaction volume.
User Data	Analyze customer contribution and unique-user activity.
Service Data	Compare transaction value across services.
Payment Status	Monitor successful, pending, and failed outcomes.
Date / Month	Analyze trends and month-over-month movement.
Demographic Data	Understand contribution by age segment.

The dashboard and the supplied project specification confirm transaction, user, service, age-segment, payment-status, and time-based analytical views. Exact source column names and the physical schema can be documented separately from the PBIX model.

05 Data Preparation & Transformation

The project uses **Power Query** as the data preparation layer. The intended ETL workflow is to import the source data, validate data types, standardize fields, prepare analytical categories, and create a clean dataset suitable for Power BI modeling and visualization.

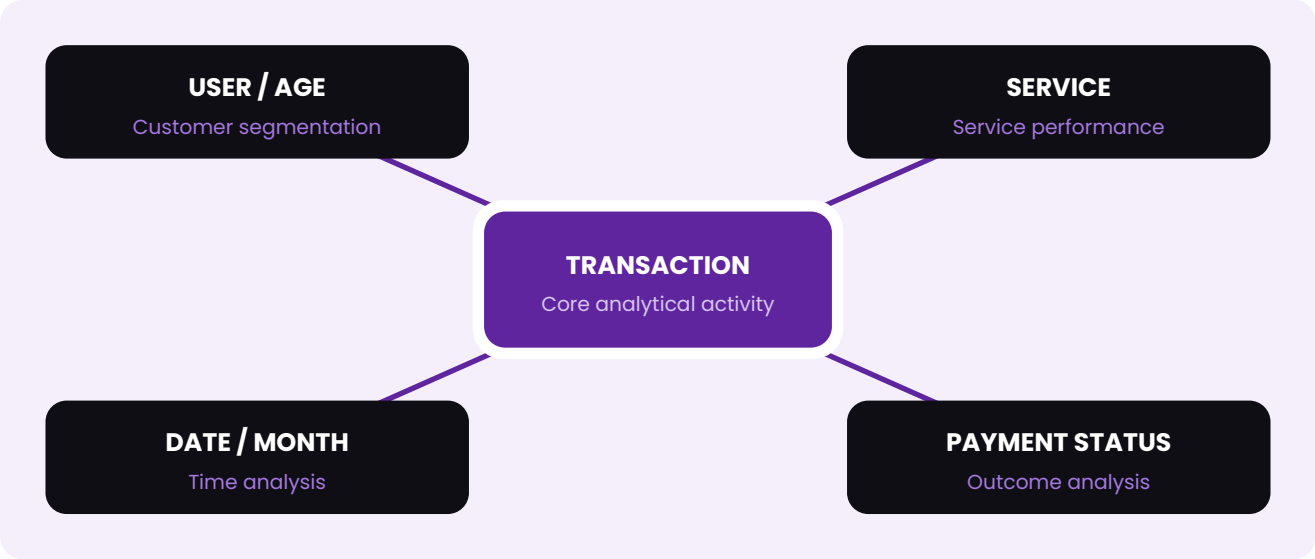

Step	Stage	Purpose
01	Import	Bring the source transaction data into Power BI.
02	Validate	Check field types and ensure numeric, categorical, and date fields behave correctly.
03	Clean	Address missing or inconsistent values where required by the dataset.
04	Standardize	Apply consistent formats and business-friendly categories.
05	Prepare	Create fields required for time, service, status, and demographic analysis.
06	Validate	Confirm that prepared data supports the intended KPIs and visuals before publishing the dashboard.

This section documents the preparation workflow at a process level; specific cleaning operations are not itemised.

06 Data Modeling

The Power BI model provides the analytical foundation for connecting transaction-level information with descriptive dimensions such as users, services, payment status, time, and age segment. The model should maintain appropriate granularity and allow filters to propagate consistently into the KPI and visual layer.

Conceptual analytical model

This diagram is conceptual. It illustrates the analytical relationships implied by the dashboard requirements rather than the exact physical schema inside the PBIX file.

07 DAX & KPI Development

DAX provides the calculation layer for executive KPIs and analytical measures. The dashboard requires measures that aggregate transaction activity, monetary value, distinct users, successful outcomes, growth, service value, and user-level transaction value.

KPI / Measure	Business Meaning
Total Transactions	Overall transaction volume within the reporting context.
Total Transaction Value	Total monetary value represented by transactions.
Unique Users	Distinct user count represented in the reporting context.
Successful Rate	Share of transactions classified as successful.
Transaction MoM Growth	Month-over-month change in transaction volume.
Transaction Value MoM Growth	Month-over-month change in transaction value.
Service Transaction Value	Transaction value aggregated by service category.
User Transaction Value	Transaction value aggregated at user level for ranking.

This section documents the purpose of each measure rather than the DAX code itself.

08 Key Performance Indicators

The KPI layer is designed to provide an immediate executive snapshot before the user moves into detailed analysis.

KPI	Value	Interpretation
Total Transactions	**300K**	Indicates overall transaction activity.
Total Transaction Value	**₹3.47B**	Indicates monetary transaction scale.
Unique Users	**108K**	Indicates customer reach represented in the dashboard.
Successful Rate	**96.00%**	Indicates a high share of successful transactions in the displayed context.
Transaction MoM Growth	**8.97%**	Indicates positive transaction momentum.
Transaction Value MoM Growth	**8.98%**	Indicates positive monetary-value momentum.

09 Dashboard Design & User Experience

The dashboard uses a structured executive layout: KPI cards at the top, analytical visuals in the center, and business insights and supporting comparisons in the lower section. The purple-and-white visual language provides a consistent hierarchy and keeps attention on the numbers.

Figure 1. PhonePe Transaction Analytics Power BI Dashboard

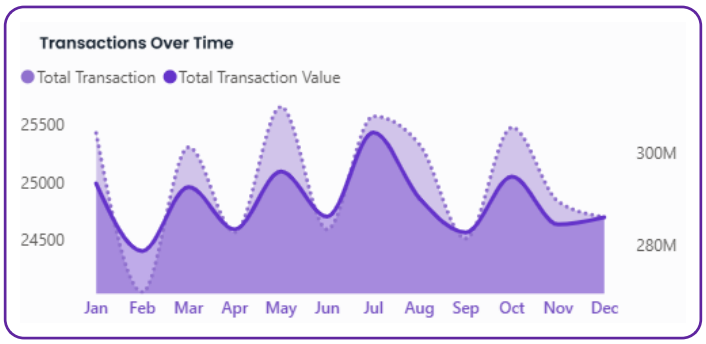

Visual-to-business-question mapping

Visual	Primary Question	Business Use
KPI cards	How is the platform performing overall?	Executive monitoring
Transactions Over Time	How does activity change across months?	Trend analysis
Age Segment Contribution	Which age groups contribute most?	Segmentation
Service Value	Which service drives transaction value?	Service prioritization
Top 5 Users	Which users have the highest value?	High-value customer analysis
Weekday vs Weekend	When is usage concentrated?	Engagement planning
Filters	How do results change by month/status?	Interactive exploration

10 Analytical Findings

Transaction trend

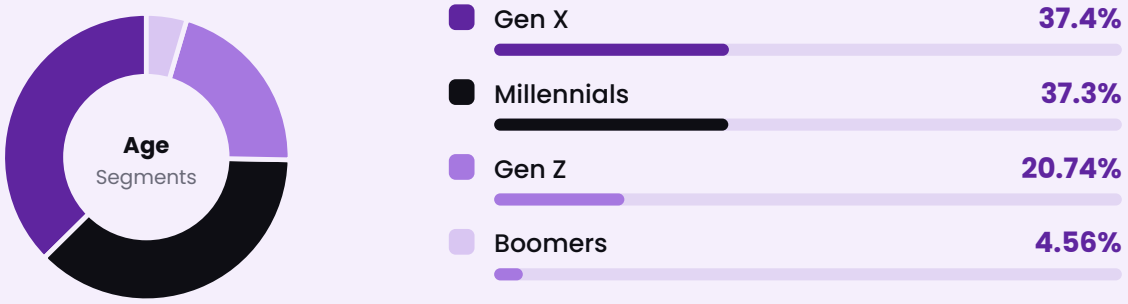

The monthly trend visual shows fluctuations in transaction activity across the reporting period. The dashboard makes it possible to identify peaks and troughs visually and to use the month filter for focused review. Exact monthly values are not available in the project specification, so no figures are assigned to individual months.

Transactions Over Time panel, as displayed on the dashboard

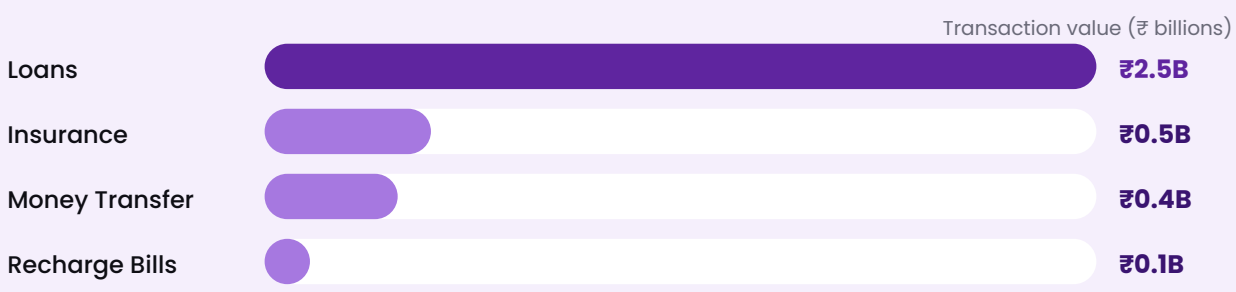

Age segment contribution

Gen X is the largest displayed age segment at **37.4%**, narrowly ahead of Millennials at **37.3%**. Gen Z contributes **20.74%**, while Boomers account for **4.56%**.

Service transaction value

Loans are the strongest displayed service category by transaction value at approximately **₹2.5B**. Insurance is approximately ₹0.5B, Money Transfer approximately ₹0.4B, and Recharge Bills approximately ₹0.1B.

Weekday versus weekend

Usage is concentrated on weekdays: **71.6%** versus **28.4%** on weekends. This pattern can inform questions about customer routines, engagement timing, and service availability.

Share of usage

Top 5 users by transaction value

Rank	User	Transaction Value
1	Michael Smith	₹1.8M
2	Jennifer Williams	₹1.6M
3	Michael Brown	₹1.3M
4	Christopher Brown	₹1.2M
5	Michael Jones	₹1.2M

11 Business Insights

01
Strong transaction performance

The dashboard records approximately 300K transactions and a 96.00% successful rate, providing a strong executive-level performance signal in the displayed reporting context.

02
Positive growth momentum

Transaction volume and transaction value both show approximately 9% month-over-month growth, indicating positive movement across the two core performance measures.

03
Gen X leadership

Gen X contributes 37.4% of the displayed age-segment contribution, with Millennials closely behind at 37.3%.

04
Loans drive transaction value

Loans contribute approximately ₹2.5B, materially higher than the other service categories shown on the dashboard.

05
Weekday-dominant usage

Weekday usage accounts for 71.6% compared with 28.4% on weekends, showing a clear concentration of activity during weekdays.

06
High-value customers matter

The Top 5 users contribute substantial individual transaction values, demonstrating the value of customer-level ranking for identifying high-value activity.

12 Business Recommendations

1 Strengthen high-value customer retention
Use the Top 5 user analysis as a starting point for deeper high-value customer segmentation and retention analysis.

2 Investigate high-value services
Examine the drivers behind the strong loan transaction value and assess opportunities for broader service adoption.

3 Optimize weekday engagement
Use the weekday-dominant usage pattern to explore campaign timing, service availability, and operational planning.

4 Monitor failed and pending transactions
Use payment-status filtering to isolate unsuccessful outcomes and investigate potential operational friction.

5 Segment customer strategies
Use age-segment differences to frame differentiated engagement hypotheses for Gen X, Millennials, Gen Z, and Boomers.

6 Monitor monthly momentum
Track transaction and transaction-value MoM measures consistently to identify changes early and support performance reviews.

These recommendations are analytical implications of the dashboard findings, not claims about PhonePe's current operating strategy.

13 Dashboard Interactivity

- **Month slicer** for period-specific analysis.
- **Payment Status selector** for outcome-focused review.
- **Dynamic KPI updates** based on the selected context.
- **Interactive visual filtering** to explore related dimensions.
- **Cross-filtering** between dashboard components where supported by the report design.

Interactivity changes the dashboard from a static report into an exploratory decision-support tool. A stakeholder can move from a high-level KPI to a specific month, payment status, service category, age segment, or user ranking without rebuilding the analysis.

Tools & technologies

Technology	Application
Microsoft Power BI	Dashboard development and visualization.
Power Query	Data preparation and transformation layer.
DAX	KPI and analytical calculations.
Excel / CSV	Source data where applicable.
Power BI Visuals	Data storytelling and interactive analysis.

14 Skills Demonstrated & Limitations

Business & Analytics

Business Intelligence | Business Analysis | Transaction Analysis | Customer Segmentation | KPI Development | Analytical Thinking | Business Insight Generation

Technical & Visualization

Power BI Dashboard Development | Power Query / ETL | DAX Calculations | Data Modeling | Interactive Visualization | Data Storytelling | Dashboard UX Design

PROJECT LIMITATIONS

- The analysis depends on the quality and completeness of the provided dataset.
- The dashboard represents historical analytical data and should not automatically be interpreted as real-time operational reporting.
- The project does not establish causal relationships between user characteristics and transaction outcomes.
- Additional geography, device, income, merchant, or operational-log data could enable deeper analysis if available.

15 Future Enhancements

01
Real-time transaction monitoring

02
Geographic and merchant-level analysis

03
Customer lifetime value modeling

04
Churn prediction and retention analytics

05
Transaction failure root-cause analysis

06
Predictive transaction forecasting

07
Machine-learning-based customer segmentation

08
Automated Power BI Service refresh

09
Advanced anomaly detection

These are proposed future enhancements and are not represented as existing features of the current dashboard.

Conclusion

The PhonePe Transaction Analytics Dashboard demonstrates a practical business intelligence workflow: translating transaction-oriented data into KPIs, interactive visuals, customer segmentation, service analysis, and decision-oriented insights. The project combines Power BI visualization, Power Query preparation, DAX-based measurement, and business storytelling in a single portfolio artifact.

From a Business Analyst perspective, the strongest value of the project is not the visual design alone; it is the connection between a business question, a measurable KPI, an analytical visual, and a potential decision. The dashboard provides a foundation for deeper operational, customer, and predictive analysis as additional data becomes available.
